

tinuous, but formed patches separated by transparent intervals. The red colour predominated in that portion of the sea which washed the southern portion of China, to the south of the island of Formosa, whilst the yellow colour was observed principally to the north of this island, in the sea known as the Yellow Sea. The water was taken from the portion of the sea which was of a red colour.

The same plant was received some years since from Ceylon by M. Montagne, so that it appears to range throughout the Indian Ocean from the coast of Africa to that of China. M. Dareste also refers to the description of an atmospheric dust by Mr. Piddington, published in the Journal of the Asiatic Society of Bengal for 1846, which he thinks contained minute forms of vegetation similar to, if not identical with, the *Trichodesmium erythraeum*.—*Comptes Rendus*, March 6, 1854, p. 461.

Mean temperature of March for twenty-seven previous years . 40°·37

Mean temperature of this month 45·14

Mean temperature of March 1853 38·24

Average quantity of rain in March for thirteen previous years 2·59 inches.

The mean temperature of this month is higher than that of any March for the last twenty-seven years, and the barometer on the 4th was as high as on any day during the same period except on two, viz. 27th December 1840, when it was 30·72, and on 1st February 1841, when it was 30·76.

On the 30th, about 8 o'clock P.M., a comet with a long tail was seen N.W. about 7° above the horizon, and remained visible to the naked eye, and attracting attention for an hour and a half, but has not been seen since then, as the sky was too cloudy for several evenings.
